

Chain Conveyor

Chain conveyors offer robust transport for pallets and flat products. Positive drive facilitates high loads on the chains. This chain conveyor has 2 lanes working together on an application for large pallet transport. This version has the metal heavy duty accumulating chain and the raised edges on the wear strips to guide the pallets can just about be seen.

This application shows two twin lane conveyors on the same framework used to transport heavy pallets. The high sided wear strip to guide the pallets can just about be seen in the photo. Multiple lanes powered from the same motor can also be specified.

- Design depending on transport goods:
 - double-tracked for empty pallets and empty pallet piles
 - triple-tracked for empty and full pallets
 - four- and five-tracked for special pallets
- Smooth run and soft segment transitions
- Plastic slide strips for chains guarantee easy running with low wear
- Drive located in the centre (underneath or sideward)
- Integrated chain tensioned for a constant segment length
- High degree of reliability and efficiency
